

## Overall Feedback of Release 2 from Muke

Very nice work; I like the efforts you have put in discussing your decisions

- Remove duplication between your work area tasks and functional reqs
- Prioritization techniques should complement each other, otherwise it makes no sense to have two separate lists of prioritization of requirements
- Split the prioritized requirements into the three releases (first, second and future)
- Revise language specification; you might need to drop three of the specifications and leave only three
- Your data requirements section is already good; there's no need for another section titled detailed data requirements
- Add business constraints and other technical requirements (under system requirements section)
- The UI prototypes colors are hard to read> considering that usability is one of the important requirements do you think the dark color blue on black background is good?
- Add a traceability matrix that links your business goals, core functionality and critical quality requirements . This can be added after system requirements section
- Consider using your prioritization to focus on improving specification of more important requirements e.g., the highly prioritized requirements could be given more detail
- Overall good work on the experience report, but revise the brainstorming part since only a definition is given rather than how you applied it and what the outcome was. Remember to also compare techniques among each other instead of describing them individually only
